# Git and Github

TingFang Lee, and Bo Gu

Git and Github?

- **Git** is a Version Control System (VCS) designed to make it easier to have multiple versions of a code base, sometimes across multiple developers or teams.
- It allows you to see changes you make to your code and easily revert them.
- **Github.com** is a website that hosts git repositories on a remote server.
- Hosting repositories on Github facilitates the sharing of codebases among teams by providing a GUI to easily fork or clone repos to a local machine.
